

Porcelain-Fused-to-Metal Crowns

For your dental health.

A porcelain-fused-to-metal crown consists of a porcelain outer layer baked onto a metal core. It is precision crafted in a dental laboratory.

Choosing a porcelain-fused-to-metal crown

When a front tooth needs a restoration, sometimes it's best to use a porcelain-fused-to-metal crown. We might choose a fused-to-metal crown to restore a tooth when a large filling has failed, or when the tooth is chipped, cracked, broken, or subject to grinding and clenching.

The advantages of a porcelain-fused-to-metal crown

A porcelain-fused-to-metal crown has several advantages:

- The metal core supports the tooth.
- It's strong enough to withstand the heaviest biting forces and resist fracturing.
- It's durable and long-lasting.
- The porcelain can be made to closely match your natural teeth.

When you need a crown, porcelain-fused-to-metal crowns are a strong and natural-looking choice.
